CUHK-X Finalist Submission Verification Guide

For finalist teams after the competition deadline

Complete the four steps below for each track in which your team is a finalist. Submit one verification package per track. Do not create or upload a new prediction.

1. Check all Selected Final Submissions on Kaggle

Open the competition page, then go to Submissions and filter by Selected. Record every submission marked Selected for this track, up to two. These are the Final Submissions used for final leaderboard evaluation.

The Selected submission with the higher private score is your primary verification target: the one that determined your official final private-leaderboard ranking and Top 15 qualification. Enter it yourself as primary_verification_submission_id; the Organizing Committee will cross-check it against Kaggle's official records. If only one submission is Selected, that submission is your target. You must disclose every Selected submission, not only the primary one.

If nothing appears under the Selected filter, Kaggle may have marked your best submission automatically for the final evaluation; check the page again after the deadline. If you still cannot find any Selected submissions, email cuhkx.competition@gmail.com.

2. Find the Submission ID for each Selected submission

Use the Kaggle account that belongs to your competition team. If the Kaggle command is not installed, install the current Kaggle CLI with pip install kaggle, then authenticate with kaggle auth login.

Small Model Track:

```
kaggle competitions submissions cuhk-x-competition-small-model-track --format "table(ref,fileName,date,publicScore)"
```

Large Model Track:

```
kaggle competitions submissions cuhk-x-competition-large-model-track --format "table(ref,fileName,date,publicScore)"
```

Match each Selected row shown on Kaggle using its file name, submission time, and public score. The value under ref is the Submission ID. Do not identify a submission using the file name alone: the same file name can appear more than once.

3. Record the exact submitted file for each Selected submission

Put into the package the exact CSV that Kaggle evaluated:

- If you kept the exact file you submitted, use that copy.
- If the Kaggle Submissions page offers a download of your submitted file, you may use the downloaded file instead.

You may rename the CSV to final_submission_1.csv or final_submission_2.csv, but do not open and resave it, reorder rows, normalize line endings, or otherwise rewrite its contents. Record its SHA-256 in submission/submission_info.yaml:

```
shasum -a 256 final_submission_1.csv
```

The Organizing Committee will cross-check the checksum against Kaggle's official records of your submitted file.

4. Submit one verification package for this track

Complete submission/submission_info.yaml and provide the following information. Map every Selected submission to the exact checkpoint, configuration, adapter, prompt, API version, or ensemble needed to reproduce it.

Field	What to provide
Kaggle Team Name	Exact team name shown on Kaggle
Track	Small Model Track or Large Model Track

Field	What to provide
Primary Verification Submission ID	The Selected submission with the higher private score (if only one is Selected, that one). Enter it yourself; the Organizing Committee cross-checks it against Kaggle's records.
Selected Submission #1	ID, Kaggle file name, time, scores, CSV path and SHA-256
Selected Submission #2	Same fields if a second submission was Selected; otherwise remove the optional block
Model and config mapping	Exact model/checkpoint/configuration associated with each Selected submission

The standard two-argument inference command must reproduce the primary verification submission. The Organizing Committee will always run the primary submission. A second Selected submission normally receives static material and mapping review only, but may be run if the review identifies a risk, inconsistency, or unresolved question. If the two Selected submissions require different models or configurations, the same inference.sh must therefore support an optional third argument containing the Submission ID.

Troubleshooting

- If the Kaggle command is not found, install the Kaggle CLI with pip install kaggle and reopen your terminal.
- If it returns 403 Forbidden, authenticate with the account that belongs to your competition team (kaggle auth login) and confirm that the account accepted the competition rules.
- If kaggle competitions submissions reports invalid choice, update the CLI with pip install -U kaggle and try again.
