CUHK-X Challenge: Selection Stage Verification Process

For the top 15 teams of the Small Model Track and the Large Model Track

The top 15 teams on the frozen private leaderboard in each of the Small Model and Large Model tracks will be invited to submit their models, inference code, and supporting documentation for verification.

1. Scope: inference reproducibility

Verification will focus on inference reproducibility; we will not retrain models or recreate teams' full development and training pipelines. The Organizing Committee will run the submitted, frozen models on the original test data and an additional held-out private dataset, supported by AI-assisted code inspection and human review. Verified rankings on the additional private dataset will be published separately for each track after verification is complete.

2. Integrity checks

Checks will cover potential misconduct, including using manually annotated test labels for training or answer lookup, substituting hard-coded or memorized answers for model inference, accessing hidden ground-truth labels, using prohibited external data or services, and changing the submitted model or method during verification. A performance decrease on private data caused by overfitting or limited generalization will not, by itself, be considered cheating. Similarly, a model that cannot run successfully may fail verification, but a technical failure alone does not establish misconduct. We will assess each case using the submitted materials, execution logs, inference results, and any explanations provided by the team. Teams will be notified of identified issues and may be asked to provide clarification or resolve compatibility problems without changing their frozen solution. Finalist places will follow the original frozen private-leaderboard order, subject to passing verification; any vacated places will be offered to the next eligible teams.

3. Process: committee-run verification, no live sessions

To improve efficiency, verification will be conducted independently by the Organizing Committee after submissions are collected, using AI-assisted checks and human review, without live Zoom verification sessions. The finals will focus on team presentations and expert Q&A, with no additional on-site inference round. Verified results from this stage will support the final assessment under the published scoring criteria.

4. Final authority

The Organizing Committee keeps final authority over the interpretation and application of the competition rules and verification decisions.
